

ANATOLY SHESHENIN

VoIP / Asterisk Engineer | Linux Telephony & CRM Integrations

Hanoi, Vietnam (UTC+7) | natepo4ty@gmail.com | +84 327 480 214

shtolyan.github.io/portfolio/ | github.com/shtolyan | linkedin.com/in/anatoly-sheshenin-b036ab66/

PROFILE

Software engineer with 10+ years of experience and hands-on Asterisk delivery in customer-facing environments. Configure Linux-based telephony systems, inbound call routing, operator queues, forwarding and CRM integrations that identify the caller and open the right customer context. Comfortable owning the full path from server setup and dial-plan logic to deployment, monitoring, troubleshooting and documentation. Strong C#/.NET and TypeScript background for building the services and integrations around telephony.

Target: Middle VoIP / Asterisk Engineer | Fully remote | Russian-speaking team | Available from Hanoi

ASTERISK & TELEPHONY

Telephony	Asterisk, SIP / VoIP, call routing, extensions, operator handoff, forwarding, dial-plan configuration
Network & media	NAT, RTP, Linux networking, connectivity diagnostics, service reliability
Integrations	CRM caller identification, call-event delivery, customer-card popups, HTTP APIs, WebSocket, C#/.NET, TypeScript
Operations	Linux servers, Docker, Git, CI/CD-minded deployments, logs, monitoring, incident troubleshooting
Data	SQL, PostgreSQL, MariaDB / MySQL concepts, Redis, structured call and customer context

RELEVANT EXPERIENCE

Airop | Software Engineer / Telephony & Automation

Customer-facing engineering work | Linux / Asterisk environments

- Multitenant telephony migration: moved 15 customers from one shared, context-separated Asterisk to Kamailio as the SIP edge, rtpengine for media handling and one isolated Docker Asterisk instance per customer.
- Fault isolation: removed the shared failure point; a reload, dial-plan error or crash for one customer no longer affects the other 14.
- Single public entry point: routed all traffic through one public IP and SIP port; Kamailio handled domain/DID routing, brute-force and fraud protection, and per-customer concurrent-call limits.
- NAT and media reliability: used rtpengine to solve RTP through Docker; customer Asterisk instances exposed no public ports, eliminating one-way audio and call drops.
- Resource isolation: applied per-customer CPU and RAM limits with cgroups so recording, transcoding or IVR load from one tenant could not degrade call quality for others.
- Automated operations: generated configuration from a shared PostgreSQL-backed source of truth, automated customer provisioning and deployed Asterisk updates progressively in stages.
- Integrate telephony events with CRM systems so teams can identify who is calling, open the matching customer card and keep call context attached to the interaction.

Production stack: Asterisk, PJSIP, Kamailio, rtpengine, Docker, PostgreSQL, Linux

Legal services company | Software / Infrastructure Engineer

Asterisk deployment from zero | Linux server environment

- Deployed an Asterisk-based office telephony system from the initial Linux server setup through working extensions and production call flows.
- Configured incoming routing, operator delivery, internal extensions and call forwarding for a distributed legal-services workflow.
- Handled practical troubleshooting across network connectivity, service configuration and day-to-day reliability for non-technical users.

ADDITIONAL ENGINEERING EXPERIENCE

- Lunkin Game / Team Lead: technical planning, architecture refactoring, performance work, code reviews and mentoring.
- Business AI / Custom CRM: integrated assistants and MCP services with CRM data and business operations.
- Earlier IT engineering: business applications, databases, server infrastructure and customer-facing technical support.

IMPLEMENTATION STRENGTHS

- Call flows: translate business rules into clear routing, operator handoff, forwarding and fallback behavior.
- CRM context: connect caller identity and call events to customer records without losing the operational context.
- Production ownership: work directly with Linux servers, logs, configuration, deployment and incident resolution.
- Integration code: extend telephony systems with typed services, HTTP APIs, database access and automation.
- Communication: Russian-speaking engineer with English at B2 level; explain technical behavior clearly to customers and teammates.

SELECTED PROJECTS

Flashback | TypeScript, Fastify, PostgreSQL, React Native / Expo, Docker

Built an agent-facing bug tracker with revision checks, ownership, investigation context and verification history. The same habits apply to telephony operations: preserve context, make changes traceable and verify the actual result.

Hex Live / Agent Studio | C#, MCP, structured execution, persistent state

Designed tool-driven agent workflows with permission boundaries, command reconciliation, cancellation and state verification. This strengthens the integration mindset needed for reliable automation around calls and CRM systems.

TECHNICAL TOOLBOX

Telephony	Asterisk, SIP, VoIP, NAT, RTP, call routing, forwarding, operator workflows
Backend	C#, .NET, TypeScript, Fastify, HTTP APIs, WebSocket, REST, JSON
Infrastructure	Linux, Docker, Git, CI/CD workflows, logs, service diagnostics, server operations
Data	SQL, PostgreSQL, MariaDB / MySQL, Redis, data modeling and integrations
Engineering	Architecture, debugging, performance optimization, code review, documentation, customer delivery

PROFESSIONAL EXPERIENCE

Lunkin Game - Team Lead / Unity Developer

Nov 2022 - Present

Technical planning, architecture refactoring, performance optimization, reviews, mentoring and production delivery.

Royal Ark - Unity Developer

Feb 2022 - Oct 2022

Gameplay and client-side engineering in a product development team.

Sitronics KT - Senior Lead Developer

Jul 2021 - Jan 2022

Interactive training systems, synchronized scenarios, scoring and instructor interfaces.

Hypemasters - Unity Developer

Jun 2020 - Jul 2021

Gameplay systems and multiplayer development with Photon Quantum.

Varwin - Unity Developer

Jan 2018 - Jun 2020

VR experiences and shared multiplayer environments for HTC Vive and Oculus.

Earlier: IT Lead / C# Developer / IT Engineer

2011 - 2017

Business applications, databases, server infrastructure and technical operations.

EDUCATION

Bonch-Bruевич Saint Petersburg State University of Telecommunications - Bachelor's degree, Computer Software and Automated Systems (2004-2009)
